## Geophysical Research Letters: New Policies Improve Top-Cited Geosciences Journal

*Geophysical Research Letters (GRL)* is the American Geophysical Union's premier journal of fast, groundbreaking communication. It rapidly publishes high-impact, letter-length articles, and it is the top-cited multidisciplinary geosciences journal over the past 10 years, with an impact factor that increased again in 2009, to 3.204. For manuscripts submitted to *GRL*, the median time to first and final decision is 23 and 27 days, respectively—a 35% improvement since 2007—and the median time from submission to publication is 13 weeks for 90% of *GRL* papers—a 25% improvement since 2007. Among high-impact publications in the geosciences, *GRL* has the fastest turnaround.

*GRL*'s mission is to disseminate high-impact, broad-implication, innovative, and timely research on major scientific advances in all AGU disciplines. *GRL*'s status and service continue to improve, due to an outstanding pool of authors and reviewers, a dedicated editorial board that covers all of the major geoscience disciplines, and a highly efficient staff in the AGU publications office. The board is committed to ensuring the publication of top-quality papers in a timely manner, through a fair and efficient evaluation process.

To continue improving its status and service to the community, *GRL* has instituted a number of changes over the past few years. Some of these changes have already been highlighted by previous *GRL* editor in chief James Famiglietti in a 2007 *Eos* editorial (88(49), 537; see [http://www.agu.org/pubs/pdf/Editorial\\_GRL.pdf](http://www.agu.org/pubs/pdf/Editorial_GRL.pdf)). Here we briefly review the status of these and subsequent changes and how they are helping to increase the journal's relevance, impact, and efficiency.

*GRL* has significantly increased the number of manuscripts returned without formal peer review, a process common to most top-tier science journals. These decisions most often concern papers that are too regional or technical in scope, lack sufficiently broad geophysical implications, represent an incremental advance beyond what has already appeared in peer-reviewed literature, or the content of which does not justify rapid publication. These decisions rarely reflect a judgment on the quality of the work—which is often high—but rather that the material is better suited for a journal other than *GRL*. This practice not only provides authors the earliest possible opportunity to submit their work elsewhere but also helps to decrease the intense reviewing pressure placed on the AGU community by *GRL*'s large volume of submissions (between 3000 and 4000 per

year over the past 5 years) and the need for rapid review.

In keeping with its mission to be a fast-track and high-impact journal, *GRL* has for more than 3 years executed a policy of rejecting papers for which major revisions are required to meet the *GRL* criteria of impact, innovation, and timeliness. For example, manuscripts are routinely declined if the reviews point to a need for additional analyses, simulations, or other significant changes to support purported high-impact results or implications. However, for those submissions that show promise of reaching *GRL*'s criteria, authors are encouraged to resubmit following necessary revisions. While "resetting the clock" on manuscripts that require major revisions reduces the time-to-publication dates, the policy is motivated not by a desire to make the *GRL* editorial process appear as rapid as possible but rather by a desire to make the process be as rapid as possible. While the policy of rejecting manuscripts that require major revisions is potentially controversial, experience over the past decade shows that this results in a more rapid, high-impact publication experience for authors as well as for readers, thereby improving the editorial board's ability to serve *GRL*'s unique mission within the AGU body of publications.

A more recent development is that *GRL*'s editorial board unanimously proposed abolishing comments and replies, a proposal that was approved by the AGU Publications Committee late in 2009. In the absence of a formal comment and reply process, the board encourages authors to present their critique of a paper that has been published in *GRL* as a regular, stand-alone manuscript. In this way, the scientific debate can be enhanced through the rapid publication of explicit scientific evidence that supports an author's criticisms. Since removing comments and replies, *GRL* has published a number of papers that have directly critiqued work recently published in the journal. The review and ultimate publication of these papers have been far more rapid than for the comments and replies that were previously handled by *GRL*. In addition, the scientific content has been substantive, with the papers standing on their own as scientific contributions.

*GRL* has also recently begun to publish a limited number of "frontier" articles, by invitation from the editors. Frontier articles are 50% longer than regular *GRL* papers and are freely available via open access for the first 6 months after publication. They present a perspective on recent cutting-edge advances in a leading scientific field that is

at the forefront of one or several AGU disciplines. They may also deliver a visionary but strongly scientifically grounded statement about a particularly promising up-and-coming field of research that has potential for high impact and broad implications.

Finally, in addition to *GRL*'s emphasis on rapid publication, the editorial board is working hard to increase the value of publishing in *GRL* for its authors. Approximately 15% of *GRL* articles are spotlighted in *Eos* and on the *GRL* Web site and are brought to the attention of the press. In addition to these spotlights, the editorial board is also working with the AGU press office to increase the visibility of top papers and authors via press releases, press conferences, AGU blogs, and social networking sites such as Twitter and Facebook. As a result, *GRL* articles are being more and more frequently featured in major print, broadcast, and Web media, as well as in perspectives and news articles in high-profile magazines such as *Science* and *Nature*.

All of the above policies and practices have been enacted to better serve the long-established mission of *GRL* to publish significant geophysical advances that will have immediate impact on the research of others. While these policies and practices are not without controversy, experience and quantitative evidence suggest that they are in fact improving *GRL*'s achievement of its mission, and therefore its service to the AGU community.

None of this progress would be possible without the commitment of authors and reviewers to the larger AGU mission of "promoting discovery in Earth and space science for the benefit of humanity." *GRL*'s editorial board serves the community by promoting the journal's attractiveness and increasing its selectivity and publication speed, but authors and reviewers are essential to *GRL*'s success in rapidly communicating top-quality and timely science to the AGU community and the world beyond. We are grateful for all of the effort that authors, reviewers, and previous editors have expended to make *GRL* the top choice for rapid publication of today's highest-impact geoscience, and we look forward to further strides in the months and years to come.

### GRL Editors Sought

AGU is looking for dynamic, well-organized scientists with high editorial standards and strong leadership skills to serve as editors of *Geophysical Research Letters*. **The search committee is currently looking for candidates in the field of planetary sciences.** The new editors will be appointed for a 3-year term, beginning as soon as possible.

Applicants should be respected leaders in the community, independent-minded, and evenhanded. As editor you should be committed to further strengthening *GRL* as a leading AGU letters journal, be proactive in attracting innovative contributions in traditional disciplines and emerging fields, and be able to commit to *GRL*'s fast publication pace. The Union is interested in attracting papers in developing areas and ensuring that readers of *GRL* receive the best, most timely, and highest-impact information possible.

As editor you will

- have full authority to accept or reject submitted papers
- handle the review process
- seek out stimulating papers for inclusion in the journal.

A search committee appointed by the AGU president evaluates candidates and conducts personal interviews with a small number of highly qualified individuals. The president makes the final selection and appointment. All AGU editors serve at the pleasure of the president.

If you would like to be considered as an editor of *GRL*, send your curriculum vitae with a letter of interest via e-mail to [pubmatters@agu.org](mailto:pubmatters@agu.org). If you would like to nominate a highly qualified colleague, send a letter of recommendation to the same e-mail address. **Please specify GRL in the subject line of the e-mail.**
